8.1.2

8.2 What's Next

This document lists the features merged into the master branch for the next minor release.

8.2.1 Post-v1.14.0

- NetworkPolicy supports `lax` mode which only deny traffic type of TCP, UDP and SCTP. That means ARP, ICMP and DHCP traffic are always allowed. [#5745](#)
- Remove internal-port type interface code. [#5794](#)
- IPPool
- Multiple IPPools now can bind to the same Namespace. [#5731](#)
- Pods in a bound namespace will only get IPs from the bound pool(s), not other ranges in the subnet. [#5731](#)
- AdminNetworkPolicy now supports specify egress peers using FQDNs. [#5703](#)
- Using ARP for IPv4 network ready check: now you don't need ACL allow rules for gateway to make Pod running. [#5716](#)
- Non-primary CNI mode: you can run Kube-OVN as the secondary only network, without annoying unused annotations and logical switch port allocations. [#5618](#)
- VPC NAT Gateway:
 - No default EIP mode: the secondary interface can initialize without a default EIP to avoid the waste. [#5605](#)
 - Custom routes: you can control the route rules within the vpc-nat-gateway Pods to control traffic paths. [#5608](#)
 - Gratuitous ARP: VPC NAT Gateway automatically sends gratuitous ARP packets during initialization to accelerate network convergence. [#5607](#)
 - Healthchecks for static endpoints in `SwitchLBRules`: SLR with both selector or endpoints key can support healthchecks. [#5435](#)
- Underlay
 - Node Selectors for `ProviderNetwork`: instead of adding/removing nodes to the `ProviderNetwork` one by one, you can use node selectors to simplify the workflow. [#5518](#)
 - Different `NetworkProvider`s can now share the same VLAN. [#5471](#)
 - Adding `pod_name` and `pod_namespace` labels to interface metrics. [#5463](#)
- IPSec
 - Support `cert-manager` to issue certificates. [#5365](#)
 - Request new certificate if current certificate is not trusted. [#5710](#)
- kubectl-ko
 - Collect IPSec and xFRM information. [#5472](#)
 - Replace `Endpoint` with `EndpointSlice`. [#5425](#)
- NetworkAttachment caching: reduce APIServer load in large-scale deployments with Multus. [#5386](#)
- Upgrade ovs to 3.5 and OVN to 25.03. [#5537](#)
