3.6 EIP 和 SNAT 配置

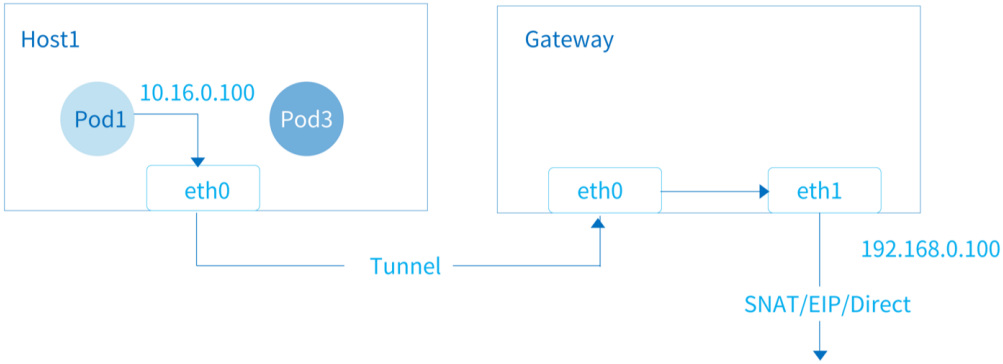

> 介绍如何在 VPC 网络中使用 VPC 内部的 NAT网关。

- VPC Iptables NAT 配置
- VPC OVN NAT 配置

> 在 VPC 网络中创建外部网络, 并连通外网。

- 介绍如何在 VPC 内部署 OVN NAT 网关并在 pod annotation 中进行相关配置
- 介绍如何在 VPC 网络中创建 OVN NAT 网关并通过 provider-network、vlan、subnet CRD 以及相关配置创建 ovn-eip、ovn-dnat、ovn-fip、ovn-snat CRD 来实现 EIP 和 NAT功能。详见VPC OVN NAT 配置
- 介绍如何在 VPC 网络中创建 Iptables NAT 网关并配置详见VPC Iptables NAT 配置

Kube-OVN 支持 OVN 的 L3 Gateway 功能将 Pod 访问 SNAT 和 EIP 访问外部时 SNAT为 Pod 所在节点 IP 地址，EIP 访问外部时 Pod 的 IP 地址为对应的 EIP 地址，Pod、Pod 访问外部 EIP 地址不变

3.6.1 使用场景

- 支持 OVN 的 L3 Gateway 功能，通过 OVS 隧道将 Overlay 和 Underlay 网络打通
- 支持 NAT 网关访问 Underlay 网络中的外部网络
- 支持 EIP 和 SNAT 的创建和删除

3.6.2 配置说明

在 `kube-system` 中创建 ConfigMap `ovn-external-gw-config`：

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: ovn-external-gw-config
  namespace: kube-system
data:
  type: "centralized"
  enable-external-gw: "true"
  external-gw-nodes: "kube-ovn-worker"
  external-gw-nic: "eth1"
  external-gw-addr: "172.56.0.1/16"
  nic-ip: "172.56.0.254/16"
  nic-mac: "16:52:f3:13:6a:25"
```

- `enable-external-gw`：是否启用 SNAT 和 EIP 功能
- `type`：`centralized` 或 `distributed`，默认为 `centralized` 模式，`distributed` 模式暂不支持
- `external-gw-nodes`：`centralized` 模式下的网关节点

2025 Kube-OVN Team

- `external-gw-nic` : ⬚⬚⬚⬚⬚⬚⬚⬚⬚⬚⬚⬚⬚⬚⬚

5.4 Egress Gateway BGP 和 EVPN 配置

> **警告**
>
> BGP 和 EVPN 配置涉及网络底层协议，请确保您了解相关概念后再进行操作。
>
> 本节将介绍：
>
> - 如何配置 L3VPN 和 L2VPN
> - 如何在 FRR 模式下使用 Pod
> - 如何配置 BGP BFD

5.4.1 概述

VPC Egress Gateway 支持通过 BGP 和 EVPN/VXLAN 协议将 Egress Gateway Pod 中的 FRR（Free Range Routing）与外部 BGP 和 EVPN 设备建立连接。Gateway 的 init 容器会根据 BgpConf 和 EvpnConf 配置好 FRR 的配置

通过 BGP 协议，Egress Gateway 可以 BGP 协议将 EVPN 中，init 容器会为 Pod 创建 Linux VRF、bridge 和 VXLAN 设备，L2VPN EVPN 模式下会创建 VXLAN 设备并将 Egress Gateway Pod 加入Kubernetes 集群中的 Geneve。

> 注意：目前仅支持 BGP 协议，不支持 kube-ovn-speaker 将 Pod/子网/Service 路由宣告

5.4.2 使用场景

在 BGP/EVPN 网络环境中使用 VPC Egress Gateway 时，通过 Multus-CNI 插件

在数据中心网络 BGP协议中 EVPN协议中，通过 BGP 协议

5.4.3 配置说明

创建 **BgpConf 资源**

BgpConf 资源定义了与外部 BGP 设备的连接

```
apiVersion: kubeovn.io/v1
kind: BgpConf
metadata:
  name: bgp-conf-6502
spec:
  localASN: 65002
  peerASN: 65001
  neighbours:
    - 10.0.1.1
  holdTime: 90s
  keepaliveTime: 30s
  connectTime: 10s
  ebgpMultiHop: true
```

本地使用的 AS 号为 65002，对端 AS 号为 65001 ，BGP 连接的对端地址为 10.0.1.1，启用了 EBGP Multi-Hop。

创建 **EvpnConf 资源**

EvpnConf 资源定义了与外部 EVPN 设备，EvpnConf 需要与 BgpConf 配合使用

```
apiVersion: kubeovn.io/v1
kind: EvpnConf
metadata:
  name: evpn-conf-1016
spec:
  vni: 1016
  routeTargets:
    - "65000:1016"
```

6.1.5 Pod/VM 和 VMI 抓包

`capture` 支持三种目标：`--pod` 和 `--vm` 和 `--vmi` 都会先解析 目标 `-D` 会把文件 `-i` 和 `-c` 和 `-s` 和 `-nn` 和 `-w -` 会把 `-w -` 的 pcap 写到 stdout，其他输出写到 stderr。

```
kubectl ko capture --namespace app --pod web -- -w - > capture.pcap
kubectl ko capture --vm app/database -- -w - > vm.pcap
kubectl ko capture --namespace app --vmi database -- -c 10
```

对 agent 所在节点执行 Linux `AF_PACKET` socket 和 `setns(2)` 进入 `tcpdump` 和 `nsenter` 的 shell，抓取 Ethernet 层 的 pcap 数据流。

KubeVirt 目标解析

- `--vm` 会先 VMI 会 VM 会 `--vmi` 直接 VM 的同名 VMI。
- 会读 VMI controller UID，找到 launcher Pod。
- 如果找不到 launcher，会报错，不会 launcher，也不会 launcher。
- launcher 不是 Running，也会拒绝，避免把 VMI/Pod 网络命名空间 `--pod` 当成 launcher。
- 如果同一个 VMI 有多个 launcher，会选择最新的那个。

如果目标是 VMI，会 launcher Pod，再 `--vm` 直接 VM。`network inspect` 会 OVSDB 找 Pod 对应的 OVS 接口，用 Pod UID 匹配 cgroup 路径，再 Pod 网络命名空间 里的 RX/TX 接口，把 Pod 网络命名空间 JSON 写到 64 个 字节缓冲区，`stats64` 优先，`stats` 兜底。

6.1.6 连通性诊断

connectivity 对 UDP 端口 `health check` 默认使用 echo 协议，DNS 协议 UDP 端口 subnet 的 listener。

cluster/node/subnet 目标会额外 Internet，ICMP 协议 `--external-address IP` 地址。

```
kubectl ko diagnose cluster --external-address 1.1.1.1 --external-address 2606:4700:4700::1111
```

每个 Pod 会分配 IP 并记录 其中的 UID，写入cluster/node/connectivity 目录 pinger 会 service account，挂载 Pod 的 pinger UID 的 Ready 状态 Pod 的 host PID 和 `SYS_ADMIN` 能力，agent 会 service-account token。subnet 的 DaemonSet 会挂载 Pod 会 挂载 Pod 的网络命名空间。

`logs` 下 `kubectl-ko-log/<node>/{kube-ovn,ovn,openvswitch,linux}` 目录 会 central 目录 `ovn/central-<pod>` 的 `manifest.json` 文件 并校验 `--strict` 模式下的文件权限 和属主，Unix 会 Windows 的 ACL，Unix 会 Windows ACL，并写入 NTFS 文件 的扩展属性。

Linux 节点会 Kubernetes API 读取 Linux 会 CNI Pod，agent 会为 XFRM 接口 `nokeys` 模式IPsec 目录 CNI Pod UID 的 charon 目录 agent 的 strongSwan 控制 socket。会 `ipsec.conf` 和 CNI 配置 和 Pod 的/proc，IPsec 会 daemon 目录 和 Linux 内核 的 XFRM 状态。

`db nb restore` 会 NB 数据库 和 SB，`--source-node` 和 `NODE_IPS` 决定 bootstrap 的 `NODE_IPS` 目录central hostPath 目录 central Deployment。 OVS 数据库 hostNetwork helper 会 hostPath。 OVS 的 hostPath 和 central 的helper 和 central 的 security context 的 UID 和

和 `--dry-run` 只预览 `--yes` 才helper 会 central 的 central Pod 的 RAFT header 和 JSON 状态，并 `/etc/ovn/.kubectl-ko-recovery-<id>` 和 central 的 glob 匹配。

`perf run` 在 Service 上跑 30 秒 OVN LB 目录 chassis，qperf 客户端 LB。 `restart` 和 OVN/OVS 守护进程 `perf recovery --yes` 恢复。

6.1.7 进入 agent 节点

通过 Kubernetes `pods/exec` 进入 agent helper 进程 目录 gRPC 协议 agent，agent 和 socket，service-account token。会 `kube-ovn-cni` 和 `ovs-ovn` 和 `ovn-central` 容器 会 Pod 目录 Kubernetes 的workload exec 会 WebSocket，目录 SPDY。 helper 会创建 stdin 目录 exec 会话，并 agent 创建 Linux 伪终端 130。 目录 session 结束后 清理。

如果当前用户 agent 对 `pods/exec` 没有 workload 的权限 或者读取 get/list，agent 会 `pods/exec` 会 pods/log。 会 create/delete，rollout 目录 workload patch/scale。 `pods/exec` 权限，会 Kube-OVN 会

7.15 VIP 与 IP

VIP 即为 IP，可以为 IP 或为VIP 分配给 OpenStack Neutron Allowed-Address-Pairs（AAP）或者 OVN Switch LB Rule 使用。VIP 与 Pod 的关联通过 `IP` 资源在 IPAM 中为VIP 分配与 Pod 的关联，或者 VIP 的静态绑定。

- Allowed-Address-Pairs VIP
- Switch LB rule VIP

7.15.1 1. Allowed-Address-Pairs VIP

这种类型的 IP 可以被 Pod 静态绑定使用。

- Kubernetes 与 Kubernetes 集群内 Kubernetes 与 Underlay 网络的 Subnet 互通
- LB 后端地址为集群内 Subnet 的 IP，可以为 Pod。

为VIP 分配 Allowed-Address-Pairs 的 IP 后，可以将 IP 绑定到

- Keepalived 虚拟出的 IP 等需要漂移使用的场景

1.1 创建静态 **VIP**

可以通过指定 IP 从 IP 池中创建，yaml 示例：

```
apiVersion: kubeovn.io/v1
kind: Vip
metadata:
  name: vip-dynamic-01
spec:
  subnet: ovn-default
  type: ""
```

- `subnet`：指定 Subnet 获取 IP。
- `type`：可以为空或者 ipam ip 类型 `switch_lb_vip` 类型 vip 类型 switch lb 的 vip 类型 ip 类型。

查看创建的 VIP。

```
# kubectl get vip
NAME             V4IP         PV4IP   MAC                PMAC   V6IP   PV6IP   SUBNET        READY
vip-dynamic-01   10.16.0.12           00:00:00:F0:DB:25                       ovn-default   true
```

可以 VIP 地址为 `10.16.0.12` 的 IP 已经被成功分配。

1.2 创建静态 **VIP**

指定 VIP 的 IP 地址，yaml 示例：

```
apiVersion: kubeovn.io/v1
kind: Vip
metadata:
  name: static-vip01
spec:
  subnet: ovn-default
  v4ip: "10.16.0.121"
```

- `subnet`：指定 Subnet 获取 IP。
- `v4ip`：指定 IP 地址，需在 `subnet` 的 CIDR 范围。

查看创建的 VIP。

```
# kubectl get vip
NAME             V4IP         PV4IP   MAC                PMAC   V6IP   PV6IP   SUBNET        READY
static-vip01   10.16.0.121          00:00:00:F0:DB:26                       ovn-default   true
```

可以 VIP 已经绑定 IP 了。

1.3 Pod 绑定 VIP 和 AAP

Pod 通过 annotation 绑定 VIP 和 AAP 的。Pod 的 labels 匹配 VIP 的 `selector` 来绑定的。

Pod annotation 中指定 VIP，格式为ovn.kubernetes.io/aaps: vip-aap,vip-aap2,vip-aap3

AAP 可以绑定多个 Pod 实现多个AAP 对 Pod 的 VIP 的 subnet 的 Port 的共享

1.3.1 创建 VIP 和 AAP

```
apiVersion: kubeovn.io/v1
kind: Vip
metadata:
  name: vip-aap
spec:
  subnet: ovn-default
  namespace: default
  selector:
    - "app: aap1"
```

VIP 的参数说明如下：

- `namespace`：AAP 和VIP 的命名空间，VIP 的命名空间和 AAP 的
- `selector`：AAP 的标签和 VIP 的和 Pod 的命名空间和 `namespace` 的 Pod的标签和 `key: value` 的格式，多个标签为 AND 的

创建后查看 VIP 的 Port：

```
# kubectl ko nbctl show ovn-default
switch e32e1d3b-c539-45f4-ab19-be4e33a061f6 (ovn-default)
    port aap-vip
        type: virtual
```

```
apiVersion: v1
kind: Pod
metadata:
  name: busybox
  annotations:
    ovn.kubernetes.io/aaps: vip-aap
  labels:
    app: aap1
spec:
  containers:
    - name: busybox
      image: busybox
      command: ["sleep", "3600"]
      securityContext:
        capabilities:
          add:
            - NET_ADMIN
```

查看创建的 AAP 的详细

```
# kubectl ko nbctl list logical_switch_port aap-vip
_uuid               : cd930750-0533-4f06-a6c0-217ddac73272
addresses           : []
dhcpv4_options      : []
dhcpv6_options      : []
dynamic_addresses   : []
enabled             : []
external_ids        : {ls=ovn-default, vendor=kube-ovn}
ha_chassis_group    : []
mirror_rules        : []
name                : aap-vip
options             : {virtual-ip="10.16.0.100", virtual-parents="busybox.default"}
parent_name         : []
port_security       : []
tag                 : []
tag_request         : []
type                : virtual
up                  : false
```

virtual-ip 指定的 VIP 的 IP，virtual-parents 指定的 AAP 绑定的 Pod 的 Port：

查看绑定的 Pod 的详细

```
# kubectl exec -it busybox -- ip addr add 10.16.0.100/16 dev eth0
# kubectl exec -it busybox01 -- ip addr show eth0
35: eth0@if36: <BROADCAST,MULTICAST,UP,LOWER_UP,M-DOWN> mtu 1400 qdisc noqueue
    link/ether 00:00:00:e2:ab:0c brd ff:ff:ff:ff:ff:ff
    inet 10.16.0.7/16 brd 10.16.255.255 scope global eth0
       valid_lft forever preferred_lft forever
```

```
    inet 10.16.0.100/16 scope global secondary eth0
       valid_lft forever preferred_lft forever
    inet6 fe80::200:ff:fee2:ab0c/64 scope link
       valid_lft forever preferred_lft forever
```

7.20.6 ▯▯

2025 Kube-OVN Team

7.21 OpenStack 集成

本节介绍如何将 OpenStack 虚拟机与 Kubernetes 集群中的容器网络打通。OpenStack Neutron 默认使用 OVN 作为后端，Kube-OVN 可以直接复用已有的 OVN 集群，让 OpenStack 和 Kubernetes 共享同一套逻辑网络。

7.21.1 方案概述

本方案基于 OVN-IC 多区域互联机制，将 Kubernetes 集群作为一个独立的可用区接入 OpenStack。

前提条件

1. 已部署 OpenStack 和 Kubernetes 集群，CIDR 不冲突
2. 两个集群的节点网络二层或三层可互通
3. 已规划好 IP 地址段，避免重叠
4. 已安装 Kubernetes 版本与 OpenStack 兼容的 VPC

部署 OVN-IC 数据库

在任意节点启动 `OVN-IC` 数据库：

```
docker run --name=ovn-ic-db -d --network=host -v /etc/ovn/:/etc/ovn -v /var/run/ovn:/var/run/ovn -v /var/log/ovn:/var/log/ovn kubeovn/kube-ovn:v1.17.0 bash
start-ic-db.sh
```

Kubernetes 侧配置

在 `kube-system` Namespace 下创建 `ovn-ic-config` ConfigMap：

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: ovn-ic-config
  namespace: kube-system
data:
  enable-ic: "true"
  az-name: "az1"
  ic-db-host: "192.168.65.3"
  ic-nb-port: "6645"
  ic-sb-port: "6646"
  gw-nodes: "az1-gw"
  auto-route: "true"
```

- `enable-ic`：启用互联
- `az-name`：本集群在互联中的名称
- `ic-db-host`：运行 `OVN-IC` 数据库的节点地址
- `ic-nb-port`：`OVN-IC` 北向数据库端口，默认 6645
- `ic-sb-port`：`OVN-IC` 南向数据库端口，默认 6646
- `gw-nodes`：网关节点名称
- `auto-route`：自动下发路由

OpenStack 侧配置

在 Kubernetes 侧创建测试

```
# openstack router create router0
# openstack router list
+--------------------------------------+---------+--------+-------+---------------------------------+
| ID                                   | Name    | Status | State | Project                         |
+--------------------------------------+---------+--------+-------+---------------------------------+
| d5b38655-249a-4192-8046-71aa4d2b4af1 | router0 | ACTIVE | UP    | 98a29ab7388347e7b5ff8bdd181ba4f9 |
+--------------------------------------+---------+--------+-------+---------------------------------+
```

8.1.2 ⬚⬚

8.2 What's Next

This document lists the features merged into the master branch for the next minor release.

8.2.1 Post-v1.16.0

- Add routed subnet mode with `/32` IPv4 or `/128` IPv6 Pod addresses and gateway hairpinning through the OVN logical router. #7294
- Add experimental NetworkPolicy ACL sampling with node-local decoding and `kubectl ko acl` troubleshooting commands. #7172
- QoS: support configurable ingress/egress burst limits via per-NIC annotations (`ovn.kubernetes.io/ingress_burst`). #6628
- VPC Egress Gateway: accept integer Mbps values and `M`, `Mi`, `G`, or `Gi` bit-rate quantities for per-replica bandwidth limits. #7115
- VPC NAT Gateway: allow placing the NAT gateway StatefulSet and its iptables-EIP custom resources in a user-specified namespace. #6595
- iptables-EIP: surface the bound external subnet in the `kubectl get iptables-eip` printer. #6672
- Helm Chart (kube-ovn-v2): ship PrometheusRule and Grafana dashboards out of the box. #6630

8.2.2 Post-v1.15.0

- NetworkPolicy now supports provider-scoped policies for multi-network pods using the `ovn.kubernetes.io/policy-for` annotation. #6223
- Support static IP/MAC for multiple interfaces on the same logical switch. #6060
- MetalLB underlay integration now supports IPv6 and dual-stack. #6159
- KubeVirt live-migration multi-chassis options now apply to all VM NICs, not just the primary one. #6241
- Add human-readable descriptions to all Kube-OVN CRD fields for better `kubectl explain` output. #6133 #6147
- Support BGP and EVPN (L3VPN) for VPC Egress Gateway, running FRR in the egress gateway Pod. #6224
- Support per-pod NIC granular DHCP control via annotations, overriding subnet-level DHCP settings. #6475
- Extend SecurityGroup API with tiers, larger priority range (1-16384), localAddress and port matches. #6330
- Use BigInt for SubnetStatus IP count fields to support large address ranges. #6403
- Improve hairpin logic to support FIP, SNAT from any CIDR within the VPC and LoadBalancers. #6445
- VPC NAT Gateway
- Support user-defined annotations on NAT gateway Pod template. #6256
- Allow SNAT EIP to FIP EIP traffic. #6329
- Allow any EIP to share external subnet gateway in one native VLAN. #6426
- VPC Egress Gateway
- Support custom resources and bandwidth limits. #6407
- Interconnection
- Add vendor ID to transit switches to avoid conflicts with other OVN controllers. #6186
- Reliability
- OpenFlow synchronization: detect and recover from stale or missing OVS flows automatically. #6117
- OVN DB: back up Raft header before rejoining cluster to improve recovery. #6106
- Performance
- Strip `managedFields` from informer cache to reduce memory usage. #6119
- Add field selectors to informer factory to reduce API server load. #6091
- Security
- Replace wildcard RBAC verbs with explicit verb lists. #6233
- Specify ephemeral storage limits for containers. #6259
- Helm Chart

- Make DaemonSet update strategy configurable via `values.yaml`. #6136
- Introduce `extraEnv` variable for all components. #6142
- Add `affinity` and `nodeSelector` support for ovs-ovn and ovs-ovn-dpdk DaemonSets. #6308
- Add `external-gateway-config-ns` option for controller. #6211
- Introduce ServiceMonitor and labels to services. #6340

8.2.3 Post-v1.14.0

- ACL log supports ratelimiting. #5938
- Subnet with centralized gateway now supports nodeSelectors. #5956
- Overlay encapsulation NIC selection. #5946
- Performace: skip conntrack for specific dst CIDRs. #5821
- NetworkPolicy supports `lax` mode which only deny traffic type of TCP, UDP and SCTP. That means ARP, ICMP and DHCP traffic are alaways allowed. #5745
- Remove internal-port type interface code. #5794
- IPPool
- Multiple IPPools now can bind to the same Namespace. #5731
- Pods in a bound namespace will only get IPs from the bound pool(s), not other ranges in the subnet. #5731
- IPPool will create an AddressSet that can be work with VPC Policy Route and ACL. #5920
- `AdminNetworkPolicy` now supports specify egress peers using FQDNs. #5703
- Using ARP for IPv4 network ready check: now you don't need ACL allow rules for gateway to make Pod running. #5716
- Non-primary CNI mode: you can run Kube-OVN as the secondary only network, without annoying unused annotations and logical switch port allocations. #5618
- VPC NAT Gateway:
- No default EIP mode: the secondary interface can initialize without a default EIP to avoid the waste. #5605
- Custom routes: you can control the route rules within the vpc-nat-gateway Pods to control traffic paths. #5608
- Gratuitous ARP: VPC NAT Gateway automatically sends gratuitous ARP packets during initialization to accelerate network convergence. #5607
- Healthchecks for static endpoints in `SwitchLBRules`: SLR with both selector or endpoints key can support healthchecks. #5435
- Underlay
- Node Selectors for `ProviderNetwork`: instead of adding/removing nodes to the `ProviderNetwork` one by one, you can use node selectors to simplify the workflow. #5518
- Different `NetworkProvider`s can now share the same VLAN. #5471
- Auto create VLAN sub-interfaces. #5966
- Auto move VLAN sub-interfaces to OVS bridges. #5949
- Adding `pod_name` and `pod_namespace` labels to interface metrics. #5463
- IPSec
- Support `cert-manager` to issue certificates. #5365
- Request new certificate if current certificate is not trusted. #5710
- kubectl-ko
- Collect IPSec and xFRM information. #5472
- Replace `Endpoint` with `EndpointSlice`. #5425
- NetworkAttachment caching: reduce APIServer load in large-scale deployments with Multus. #5386
- Upgrade `OVS` to 3.5 and `OVN` to 25.03. #5537
